

This project contains 5 components:

1. main.py: contains the implementation code and generates CSV files containing results data
2. script.py: used to run main.py for different number of simulations and generates plots
3. uct.py: contains implementation of UCT which is used by main.py
4. ludopy directory: contains Ludo simulator taken from the following repository:
<https://github.com/SimonLBSoerensen/LUDOPy>
5. res directory: stores CSV files generated after running main.py

Python library requirements:

1. numpy
2. pandas
3. matplotlib
4. opencv

Run the project using the following command:

```
python script.py 5000 90
```

5000 denotes the number of games (as used in paper)

90 denotes the number of CPU cores to parallelise over (can be modified according to compute availability)
