

This project contains the following components:

1. environment.py: contains Gym-like implementation of synthetic fixed horizon MDP
2. main.py: contains the implementation code and generates CSV files containing results data
3. script.py: used to run main.py for different configurations and generates plots
4. uct.py: contains implementation of UCT which is used by main.py
5. Two plots directories: stores plots generated after running script.py
6. res directory: stores CSV files generated after running main.py

Python library requirements:

1. numpy
2. pandas
3. matplotlib

Run the project using the following command:

```
python script.py 200 90
```

200 denotes the number of independent runs (as used in paper)

90 denotes the number of CPU cores to parallelise over (can be modified according to compute availability)
